**A Husband's Love Creates a New Field of Medicine**

Inspired by love, a builder and his wife developed a bodywork shown to replace surgery for two of America's most common emergency room conditions

**GAINESVILLE, FL (Sept 13, 2022)** Larry Wurn loved Belinda from the time he was three years old. As they prepared to marry at age 30, she was diagnosed with an aggressive form of cervical cancer. Emergency surgery and massive radiation therapy saved her life but left physical therapist Belinda in debilitating pain from adhesions – internal scars that can form anywhere in the body after surgery or tissue damage. Her doctors said “There is no cure for adhesions; surgery will just create more. You will be in severe pain your entire life.” The couple found this unacceptable.

As a homebuilder, Larry viewed adhesions from a structural standpoint. While they are often found throughout the body and comprised of powerful collagen fibers, he suspected a previously unseen weak spot in the structure. Dr. Amanda Rice, a PhD expert in cell structure helped confirm his suspicions. Per their group Clear Passage® Therapies, the couple developed a hands-on bodywork that not only cured Belinda, it replaced major surgeries that were considered the only cure for two of the top five emergency conditions in the USA ([JAMA Surgery](#)) – adhesive pain and life-threatening bowel obstructions.

A dozen citations and studies show their non-surgical, drug-free therapy has opened totally blocked fallopian tubes in over a hundred women. It has decreased period and intercourse pain in women with endometriosis and decreased the adhesions that can totally close intestines ([WrlJGastro](#)), which causes death unless the condition is reversed. Focused on decreasing adhesions that commonly occur in the pelvis and abdomen, the Wurns note that over 1,000 babies have been to women diagnosed infertile after receiving the therapy.

Richard King, MD, a gynecologist and Chief of Staff of a nearby regional hospital first encouraged their research. “Initially, I was shocked,” he said. “Their non-surgical results rivaled what I could do surgically, and I am considered an excellent surgeon. The fact that they can apparently access and decrease adhesions throughout the body without the risks and costs of surgery is truly remarkable.”

Safety and effectiveness of the therapy for treating female infertility, menstrual and intercourse pain and small bowel obstructions is supported by [several peer-reviewed citations and studies](#) published in medical journals available via PubMed and the National Library of Medicine.

Available in the U.S.A. and in England, treatment is generally performed over five days, with two hours of hands-on therapy each morning and afternoon. No drugs or surgery are used. Applicants complete a [Medical History Form](#) which Clear Passage reviews at no charge to determine appropriateness and likelihood of success.
