

BODYWORKERS SEEK NOBEL PRIZE IN MEDICINE

A unique bodywork is creating life and saving lives, replacing major surgery for female infertility and life-threatening bowel obstructions

[GAINESVILLE, FL – May 17, 2022] “A few doctors said we should win a Nobel Prize for developing a method to decrease adhesions non-surgically,” says massage therapist Larry Wurn. “If that occurs, we’d likely use the money to examine decreasing the adhesion-like plaques and tangles that form in the brains of people with Parkinson’s Disease.”

Physical and massage therapists have opened totally blocked fallopian tubes in hundreds of women and cleared life-threatening intestinal blockages in others per research done at Clear Passage® Therapies. Previously, these life-saving and life giving procedures required invasive surgery under general anesthesia.

“Initial reports surprised us,” says massage therapist Larry Wurn. “We were treating women with pain when several diagnosed with total tubal blockage became pregnant naturally. The Chief of Staff of a large nearby hospital became fascinated; he encouraged us to conduct research to see if we could repeat the results. When studies showed we could consistently open these tiny tubes, we started using it to clear larger tubes – the intestines.”

The focus of the therapy is to decrease internal scars called adhesions, a frequent by-product of surgery according to medical literature. Physical therapist Belinda Wurn says “Adhesions are a huge problem in medicine. They can act like glue in the body, squeezing organs or attaching them to other structures with powerful bonds. They are the main cause of blocked fallopian tubes and bowel obstructions. This therapy appears to reverse the process of adhesion formation it’s a bit like taking the body back to a time before the adhesions formed.”

“Fallopian tubes must be open for sperm to meet egg and create life; intestines must be clear to sustain life. If either is prevented, processes that create and sustain human life cannot occur,” says surgeon Richard King, MD. “As doctors, we are taught to treat these conditions by surgery, but post-surgical adhesions tend to close these organs, threatening the ability to live or have a natural pregnancy. This therapy avoids surgical problems; it appears to decrease or eliminate adhesions by detaching the bonds within them.”

Safety and effectiveness of the therapy is supported by [several peer-reviewed citations and studies](#) published in medical journals available via PubMed and the National Library of Medicine. To view a 6-minute patient story, [click here](#).

Available in the U.S.A. and in England, treatment is generally performed over five days, with two hours of hands-on therapy each morning and afternoon. No drugs or surgery are used. Applicants complete a [Medical History Form](#) which Clear Passage reviews at no charge to determine appropriateness and likely success rates.
